

VITALOOP B2B Analyze Labs API

Controlled-pilot API for external platforms that need structured blood test analysis.

What VITALOOP Provides

A partner platform sends parsed blood test biomarkers as JSON. VITALOOP normalizes the data, applies its knowledge base, rules, safety evaluation, AI/fallback protocol generation, and returns a structured analysis result the partner can render inside its own product.

Partner platform -> VITALOOP API -> Structured blood analysis -> Partner platform

Endpoint

POST /v1/b2b/analyze-labs

Input

- Partner-scoped `external_user_id`
- Biomarker list as JSON
- Optional symptoms and questionnaire data
- Optional safe integration metadata

Output

- Health summary and prioritized biomarkers
- Risks and safety flags
- Recommendations and protocol sections
- Retest suggestions and doctor summary
- Medical disclaimer and analysis metadata

Security

- API key authentication via `X-Partner-API-Key`
- Required scope: `labs:analyze`
- Tenant isolation by resolved partner key
- Redis-backed rate limits by partner and API key
- Optional IP allowlist and Cloudflare WAF for public launch
- Idempotency via `X-Idempotency-Key`

PHI/GDPR Notes

- Use opaque external user IDs where possible.
- Avoid unnecessary PHI in metadata.
- Raw payload storage is minimized during the pilot.
- Retention is partner-configurable.
- Export/delete is operator-run during the pilot.

Pilot Readiness

Suitable for a controlled pilot with 1-2 trusted partners after staging deployment, SQL migration, Redis rate limit configuration, Cloudflare rules, one test partner key, and smoke testing.
